EDUCATION

University of Southern California | GPA: 3.92

Master of Science in Computer Science

Bachelor of Science in Computer Science

Los Angeles, CA

Jan 2026 – May 2027

Aug 2023 – May 2026

TECHNICAL SKILLS

- **Languages:** Swift, TypeScript, Python, C++, JavaScript, SQL
- **Frameworks & Technologies:** SwiftUI, React, Node.js, Express, Pydantic, FastAPI, LangGraph, MCP, Electron
- **Tools & Infrastructure:** Git, Docker, Redis, Celery, SQLite, Supabase, Xcode

EXPERIENCE

Technical Founder | *Silky*

June 2026 – Present

- Founded Silky, AI-native listing automation for TikTok Shop, deployed with an apparel factory selling ~900 SKUs a year. Python, FastAPI, React, TypeScript, Supabase, Railway, Vercel.
- Built a pipeline that reads factory spreadsheets and photos, infers and maps fields to the TikTok Shop API schema, flags missing or inferred values for review, and creates the product via the API.
- Worked directly with the client as technical point of contact, turning their listing rules and edge cases, like size charts from grading templates, into the pipeline.

AI Engineer Fellow | *Handshake* • Los Angeles, CA

April 2026 – Present

- Built an agent pipeline that writes Terminal-Bench 2 tasks end to end and hardens each one with blind LLM trials until frontier models fail consistently. Over 30 tasks accepted.
- Worked in three evaluation projects: terminal tasks that make frontier LLMs fail, golden solutions and adversarial tests from production PRs, and head-to-head runs of two coding agents on one spec in matched containers.

Technical Founder | *Recallia*

June 2025 – June 2026

- Co-founded Recallia, an AI-powered iOS reflection app, and owned product strategy and full-stack development in Swift, SwiftUI and MVVM with a FastAPI and Supabase backend.
- Grew to ~200 users through user interviews, live events, and rapid iteration on direct user feedback.
- Built the Sunday Letter, an LLM pipeline that analyzes a user's week of moments and writes a personalized letter, run by scheduled background jobs on an event-driven architecture with deduplication and fault isolation.

PROJECTS

Stepper | Python, asyncio, Pydantic

July 2026 – Present

- Built stepper, a type-safe execution framework for long-running LLM and agent pipelines: checkpointed, step-based runs that resume after a crash instead of restarting. ~2,500 lines, one dependency. Runs my other agent pipelines.
- Designed import-time graph validation (missing inputs, type errors, unreachable branches), conditional routing and loops, parallel fan-out and fan-in, disk or memory persistence, and telemetry hooks for tracing, metrics and retries.

Dori | React, FastAPI, Langchain, LangGraph, OpenAI

March 2025 – May 2025

- Led full-stack development of Dori, an AI-powered dementia caregiving platform, selected as the top startup of 20 to represent USC and placed top 3 globally at the Global Student Startup Competition in Korea.
- Built reusable LangGraph nodes for an LLM workflow that generates, validates and refines personalized dementia caregiving tasks.
